Network layer: "data plane" roadmap

- Network layer: overview
 - data plane
 - control plane
- What's inside a router
 - input ports, switching, output ports
 - buffer management, scheduling
- IP: the Internet Protocol
 - datagram format
 - addressing
 - network address translation
 - IPv6

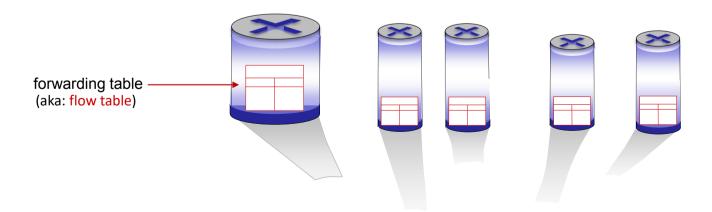

- Generalized Forwarding, SDN
 - Match+action
 - OpenFlow: match+action in action
- Middleboxes

Generalized forwarding: match plus action

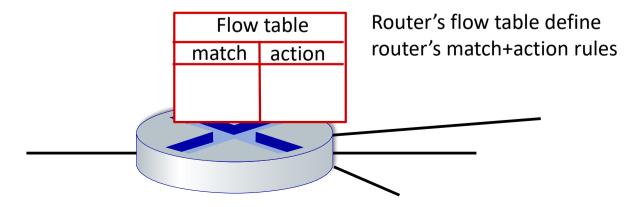

Review: each router contains a forwarding table (aka: flow table)

- "match plus action" abstraction: match bits in arriving packet, take action
 - destripotion-based forwarding: forward based on dest. IP address
 - generalized for warding
 - many header fields can determine action
 - many action possible: drop/copy/modify/log packet

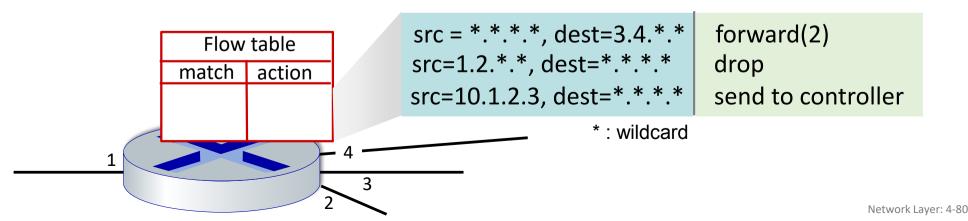

Flow table abstraction

- flow: defined by header field values (in link-, network-, transport-layer fields)
- generalized forwarding: simple packet-handling rules
 - match: pattern values in packet header fields
 - actions: for matched packet: drop, forward, modify, matched packet or send matched packet to controller
 - priority: disambiguate overlapping patterns
 - counters: #bytes and #packets

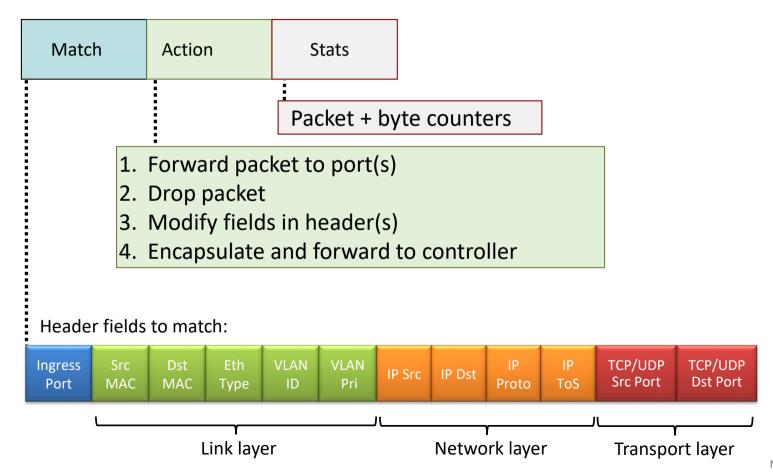

Flow table abstraction

- flow: defined by header fields
- generalized forwarding: simple packet-handling rules
 - match: pattern values in packet header fields
 - actions: for matched packet: drop, forward, modify, matched packet or send matched packet to controller
 - priority: disambiguate overlapping patterns
 - counters: #bytes and #packets

OpenFlow: flow table entries

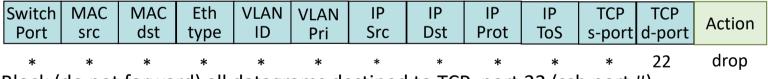

OpenFlow: examples

Destination-based forwarding:

Switch Port	MAC src	MAC dst	Eth type	VLAN ID	VLAN Pri	IP Src	IP Dst	IP Prot	IP ToS	TCP s-port	TCP d-port	Action
*	*	*	*	*	*	*	51.6.0.8	*	*	*	*	port6

IP datagrams destined to IP address 51.6.0.8 should be forwarded to router output port 6

Firewall:

Block (do not forward) all datagrams destined to TCP port 22 (ssh port #)

Switch Port	MAC src	MAC dst	Eth type	VLAN ID	VLAN Pri	IP Src	IP Dst	IP Prot	IP ToS	TCP s-port	TCP d-port	Action
*	*	*	*	*		128.119.1.1		*		*	*	drop

Block (do not forward) all datagrams sent by host 128.119.1.1

OpenFlow: examples

Layer 2 destination-based forwarding:

Switch Port	MAC src	MAC dst	Eth type		VLAN Pri	IP Src	IP Dst	IP Prot	IP ToS	TCP s-port	TCP d-port	Action	
*	*	22:A7:23: 11:E1:02	*	*	*	*	*	*	*	*	*	port3	

layer 2 frames with destination MAC address 22:A7:23:11:E1:02 should be forwarded to output port 3

OpenFlow abstraction

match+action: abstraction unifies different kinds of devices

Router

- *match:* longest destination IP prefix
- action: forward out a link

Switch

- match: destination MAC address
- action: forward or flood

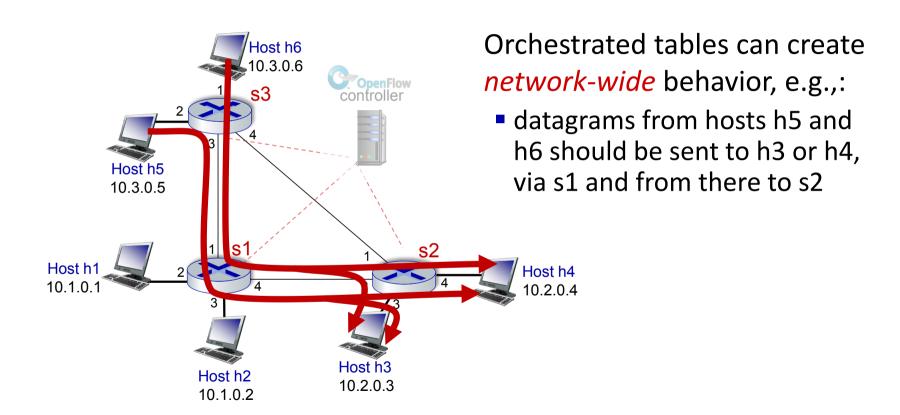

Firewall

- match: IP addresses and TCP/UDP port numbers
- action: permit or deny

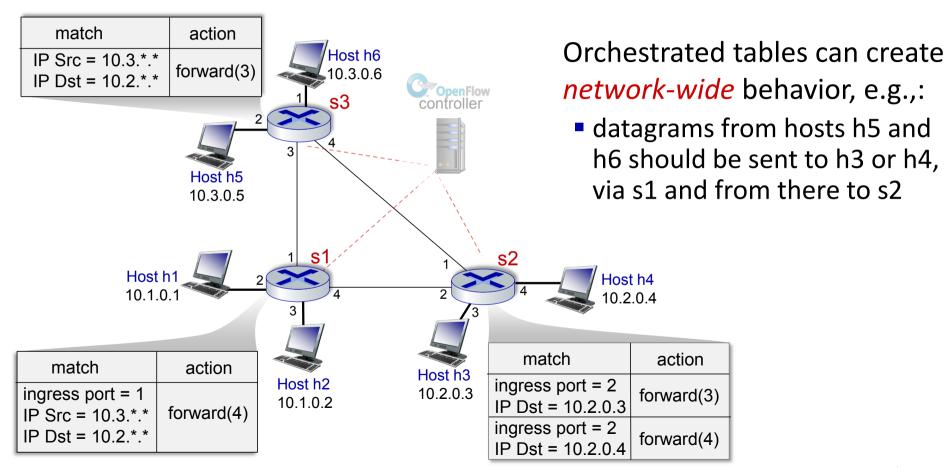

NAT

- match: IP address and port
- action: rewrite address and port

OpenFlow example

OpenFlow example

Generalized forwarding: summary

- "match plus action" abstraction: match bits in arriving packet header(s) in any layers, take action
 - matching over many fields (link-, network-, transport-layer)
 - local actions: drop, forward, modify, or send matched packet to controller
 - "program" network-wide behaviors
- simple form of "network programmability"
 - programmable, per-packet "processing"
 - historical roots: active networking
 - *today:* more generalized programming: P4 (see p4.org).

Network layer: "data plane" roadmap

- Network layer: overview
- What's inside a router
- IP: the Internet Protocol
- Generalized Forwarding
- Middleboxes
 - middlebox functions
 - evolution, architectural principles of the Internet

Middleboxes

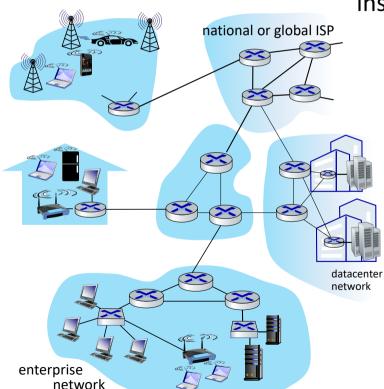

Middlebox (RFC 3234)

"any intermediary box performing functions apart from normal, standard functions of an IP router on the data path between a source host and destination host"

Middleboxes everywhere!

NAT: home, cellular, institutional

Applicationspecific: service
providers,
institutional,
CDN

Firewalls, IDS: corporate, institutional, service providers, ISPs

Load balancers:

corporate, service provider, data center, mobile nets

Caches: service provider, mobile, CDNs

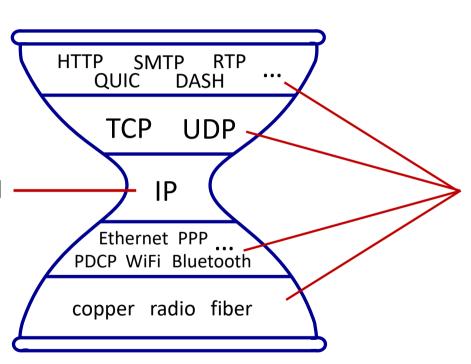

Middleboxes

- initially: proprietary (closed) hardware solutions
- move towards "whitebox" hardware implementing open API
 - move away from proprietary hardware solutions
 - programmable local actions via match+action
 - move towards innovation/differentiation in software
- SDN: (logically) centralized control and configuration management often in private/public cloud
- network functions virtualization (NFV): programmable services over white box networking, computation, storage

The IP hourglass

Internet's "thin waist":

- one network layer protocol: IP
- must be implemented by every (billions) of Internet-connected devices

many protocols in physical, link, transport, and application layers

The IP hourglass, at middle age

RTP **HTTP SMTP** QUIC **DASH TCP UDP** Internet's middle age caching VE "love handles"? TAN middleboxes, Firewalls operating inside the Ethernet PPP network PDCP WiFi Bluetooth copper radio fiber

Architectural Principles of the Internet

RFC 1958

"Many members of the Internet community would argue that there is no architecture, but only a tradition, which was not written down for the first 25 years (or at least not by the IAB). However, in very general terms, the community believes that the goal is connectivity, the tool is the Internet

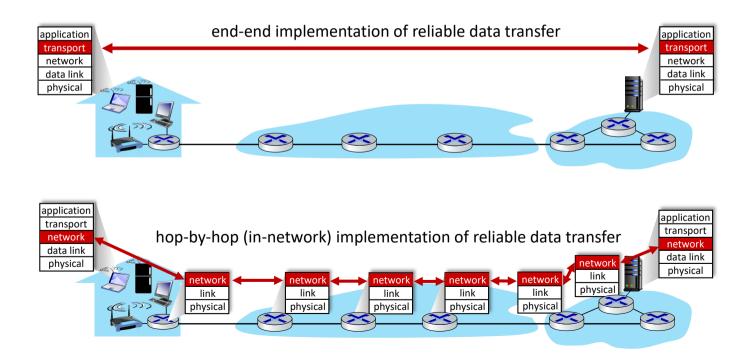

Protocol, and the intelligence is end to end rather than hidden in the network."

Three cornerstone beliefs:

- simple connectivity
- IP protocol: that narrow waist
- intelligence, complexity at network edge

The end-end argument

some network functionality (e.g., reliable data transfer, congestion)
 can be implemented in network, or at network edge

The end-end argument

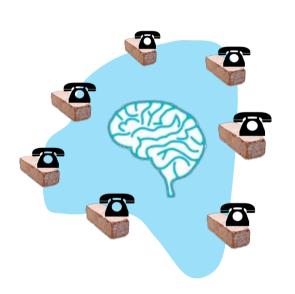

some network functionality (e.g., reliable data transfer, congestion)
 can be implemented in network, or at network edge

"The function in question can completely and correctly be implemented only with the knowledge and help of the application standing at the end points of the communication system. Therefore, providing that questioned function as a feature of the communication system itself is not possible. (Sometimes an incomplete version of the function provided by the communication system may be useful as a performance enhancement.)

We call this line of reasoning against low-level function implementation the "end-to-end argument."

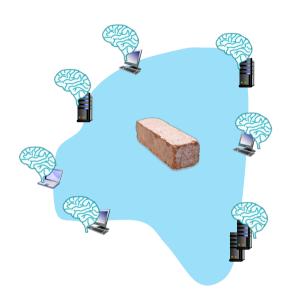

Saltzer, Reed, Clark 1981

Where's the intelligence?

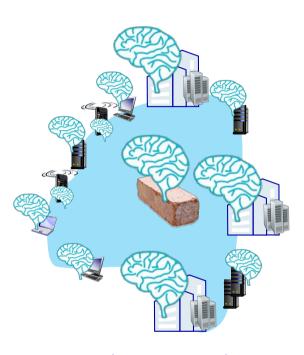

20th century phone net:

 intelligence/computing at network switches

Internet (pre-2005)

intelligence, computing at edge

Internet (post-2005)

- programmable network devices
- intelligence, computing, massive application-level infrastructure at edge

Chapter 4: done!

- Network layer: overview
- What's inside a router
- IP: the Internet Protocol
- Generalized Forwarding, SDN
- Middleboxes

Question: how are forwarding tables (destination-based forwarding) or flow tables (generalized forwarding) computed?

Answer: by the control plane (next chapter)
